Account:

- Each user has exactly one **account** where each account can only be either staff or **pet_owner**.
- When **Account** is suspended the system records the **system_admin** who suspended the account.

PET:

- A pet's name is used to identify within an **owners_pets** as an **owner** can own multiple **pets** but each pet should have a unique *first name*.
- A pet's age is derived from date_of_birth.

Staff:

- N staff can be on the N **surgical_*team's*,** *but at least one staff must be on each* **surgical team** *as each* **surgical_team** has at most one **team_leader.** This means that the minimum for each team is 2, with no limit on the maximum.
- Each **staff** member's contract and pay can only be either **continuing** or **fixed** and only **salary** or **hourly**.

Medicine

- Each **lot** of medicine can be identified by two attributes, the **lot*number*** *and the* **pharmaceutical_company_name** who made it.

Payment

- Each **payment** has a **discount percentage**, which is default set to 0. Other information such as **staff** who added the discount is not included.
- Each **payment** can cover multiple **services** where each **service** must be paid.
- A **pet_owner** can have multiple **payments** active at once

Surgical_team:

- The team has one **team leader** and one or more **staff** members making it composed of two **team** members.
- A **team leader** can lead multiple teams, and the same **team** can do multiple **surgeries**.

Service:

- **Kennel stay** does not require an end date.
- **Total cost** is derived from **services.**

Lot

- Pharmaceutical companies are not separate entities as for this model they have no other data requirements than just company name.
- Lot is identified by the composite key **pharma company name** and **lot number**
- Any number of doses can be administered per service.
